# **Batch: Hinglish**

# **Programming in C**

# **Arrays and Pointers**

DPP-02

#### [MCQ]

1. Consider the following program:

```
#include<stdio.h>
int main()
{
   int a[5]={5, 3, 1, 2, 4};
   int *p[5]={a, a+1, a+3, a+2, a+4};
   printf("%u\t%u", p[3][1], *(*(p+4)-2));
   return 0;
}
```

The output is:

(a) 53

(b) 41

(c) 21

(d) Garbage value.

## [MCQ]

**2.** Consider the following program:

```
#include <stdio.h>
int main()
{
    int a[]={2, 4, 6};
    int b[]={1, 3, 5};
    int *arr[]={a, b};
    printf("%u\t", *(*(arr+1)+2));/*line 1*/
    printf("%u\t",**arr+3);/*line 2*/
    printf("%u",***arr);/*line 3*/
    return 0;
}
```

Which of the following lines does not give ERROR?

- (a) Line 1 only
- (b) Line 1 and Line 2 only
- (c) Line 3 only
- (d) Line 2 and Line 3

#### [MCQ]

**3.** Consider the following function:

```
void f(int *p, int n)
{
    static int i;
    i=n-1;
    if(i<0) return;
    printf("%d\t", p[i]+p[n-i-1]);
    f(p,n-1);
}
If the array arr with elements [1, 2, 3, 4, 5] is passed as f(arr, 5), the output is-</pre>
```

- (a) 5 4 3 2 1
- (b) 76543
- (c) 65432
- (d) 23456

### [NAT]

**4.** Consider the following program:

```
#include<stdio.h>
int main()
{
    int a[5]={5, 3, 1, 2, 4};
    int *p[5]={a+3, a+1, a, a+2, a+4};
    int **ptr=p+3;
    printf("%u\t%u\t%u", ptr-p, *ptr-a, **ptr);
    return 0;
}
The sum of the output is ______.
```

**5.** Consider the following function:

```
void func(int (*ptr) [2])
{
    **ptr+=1;
    ptr++;
    **ptr*=3;
}
```

The array arr[2][2] with elements {0, 1, 2, 3} is passed to func(). What are the contents of the array after calling func()?

(a) 1163

(b) 0123

(c) 1 1 2 3

(d) Compilation Error.

### [MCQ]

Consider the following program:

```
#include<stdio.h>
int main()
{
 int a[][3][2]={1, 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, 23};
 printf("%u\t", a+1);
 printf("%u\t", *a+1);
 printf("\%u\t",**a+1);
 printf("%u\t", ***a+1);
 printf("%u\t", &a+1);
 return 0;
```

Assume the base address of a is 100 and integer size is 2 bytes, the output is-

- (a) 124 112 102 2 106
- (b) 124 102 112 5 106
- (c) 112 104 102 2 124
- (d) 112 104 102 5 124

## [MCQ]

Consider the following program:

```
#include<stdio.h>
```

```
int main()
  int a[3][2]=\{1, 3, 5, 7, 9, 11\};
  int *ptr=a;
  ptr+=sizeof(int);
  printf("%d", *ptr);
  return 0;
(Assume size of int to be 2 bytes.)
The output is _____.
```

Consider the following program:

```
#include<stdio.h>
int main()
   int a[][2]=\{1, 3, 5, 7, 9, 11\};
   int *ptr=a[1];
   ++*ptr++;
   printf("%d", *ptr);
   return 0;
```

The output is-

(a) 5

}

(b) 9

(c)

(d) Compilation error

# **Answer Key**

- 1. (c)
- 2. **(b)**
- 3. (c)
- 4. **(6)**

- **6.** (c)
- 7. **(5)**
- 8. **(c)**

# Hints and solutions

### 1. (c)

	1000	1002	1004	1006	1008
a	5	3	1	2	4
	2000	2004	2008	2012	2016
p	1000	1002	1006	1004	1008

### 2. (b)

printf("%u\t",\*\*arr+3);//It prints arr[0][0]+3 i.e 5 printf("%u",\*\*\*arr);// It gives ERROR as here dereferencing can happen only at two levels

#### 3. (c)

	1000	1002	1004	1006	1008	
a	1	2	3	4	5	l

 $f(arr, 5): \\ p=1000, n=5; \\ static int i; //i is initialized to 0 \\ i=n-1; //i=4 \\ 4<0: FALSE \\ printf("%d\t", p[i]+p[n-i-1]); //p[4]+p[0]=5+1=6 is \\ printed. \\ f(1000, 4) is called. \\ f(1000, 4):$ 

i=n-1; //i=33<0: FALSE printf("%d\t", p[i]+p[n-i-1]);//p[3]+p[0]=4+1=5 is printed. f(1000, 3) is called. f(1000, 3): i=n-1; //i=22<0: FALSE printf("%d\t", p[i]+p[n-i-1]);//p[2]+p[0]=3+1=4 is printed. f(1000, 2) is called. f(1000, 2): i=n-1; //i=11<0: FALSE printf("%d\t", p[i]+p[n-i-1]);//p[1]+p[0]=2+1=3 is printed. f(1000, 1) is called. f(1000, 1): i=1-1; //i=00<0: FALSE printf("%d\t", p[i]+p[n-i-1]);//p[0]+p[0]=1+1=2 is printed. f(1000, 0) is called. It simply returns. Output: 6 5 4 3 2

# 4. (6)

	1000	1002	1004	1006	1008			
a	5	3	1	2	4			
	2000	2004	2008	2012	2016			
p	1006	1002	1000	1004	1008			
ptr=p+3								
ptr-p=p+3-p=3								
*ptr-a=*(p+3)-1000=*2012-1000=(1004-1000)/2=2								
**ptr=**(p+3)=**2012=*1004=1								
Output: 3 2 1								
Su	m: 6							

### 5. (a)

The function increments the  $0^{th}$  element of  $0^{th}$  row by 1 and  $0^{th}$  element  $1^{st}$  row by 3.

Output: 1 1 6 3

### 6. (c)

a+1 points to the 1st 2D array.

\*a+1 points to the 1<sup>st</sup> 1D array of the 0<sup>th</sup> 2D array.

\*\*a+1 points to the 1st element of the 0th 1D array of the 0th 2D array.

\*\*\*a is the the  $0^{th}$  element of the  $0^{th}$  1D array of the  $0^{th}$  2D array.

&a+1 is the address of the next 3D array.

Output is:

112 104 102 2 124

7. (5)

ptr stores the address of the 0<sup>th</sup> 1D array. ptr+=2 means ptr now points to the 2<sup>nd</sup> element.

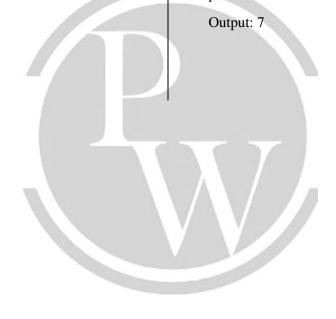

printf("%d", \*ptr);//5 is printed.

8. (c)

	1000	1002	1004	1006	1008	1010
a	1	3	5	7	9	11

ptr is a single pointer. So, it increments linearly.

ptr stores the address of (a+1). ptr=1004; ++\*ptr++ increments ptr by 1. ptr=1006
