Linked List-1 DPP 01

Discussion Notes

By- Pankaj Sharma sir

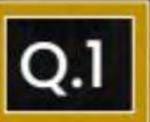

TOPICS TO BE COVERED

01 Question

02 Discussion

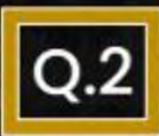

Consider a single linked list q with 2023 elements is passed to the

```
following function:
struct node {
  int data;
  struct node *next;
void f(struct node *q){
  struct node *p;
  p=q->next;
  q->next=p->next->next;
```

mext next next next next next next soon

The size of the linked list q after the execution of the function is

next

> F NULL

6000

next

6000-

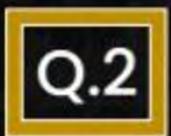

Consider a single linked list q['A', 'B', 'C', 'D', 'E', 'F'] is passed to the following function:

[MCQ]

```
struct node {
  int data;
                             next
                                      next
                                                next
                                                          next
                          A 2000
  struct node *next;
                                   B 3000
                                               40007
                                                          5000 -
                          1000
                                            3000
                                   2000
                                                       4000
                                                                5000
void f(struct node *q)
  struct node *p;
  p=q->next->next->next;
  q->next->next->next=p->next->next;
  p->next->next=q->next;
  printf("%c", p->next->next->next->data);
The output is-
```

В

D

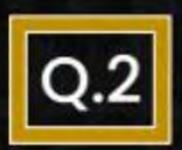

Consider a single linked list q['A', 'B', 'C', 'D', 'E', 'F'] is passed to the following function: struct node { int data; next next next next next next A 2000 struct node \*next; B 3000 E | 6000 +> |F | NULL 5000 1000 3000 2000 4000 5000 6000 void f(struct node \*q) struct node \*p; p=q->next->next->next; q->next->next->next=p->next->next; p->next->next=q->next; printf("%c", p->next->next->next->data); The output is-

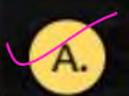

В

D

Consider a single linked list q['A', 'B', 'C', 'D', 'E', 'F'] is passed to the following function: struct node { int data; next next next next next next A 2000 struct node \*next; B 3000 5000 F NULL X 2000 1000 3000 4000 5000 6000 void f(struct node \*q) struct node \*p; p=q->next->next->next; q->next->next->next=p->next->next; p->next->next=q->next;(2000) printf("%c", p->next->next->next->data); The output is-

Q: Linked Lists supports random accessing of elements. Theoree C

Which of the following statements is/are INCORRECT?

- A. P only
- B. Q only
- C. Both P and Q
- D. Neither P nor Q

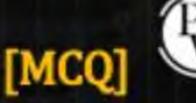

Consider a single linked list q['A', 'B', 'C', 'D'] is passed to the following

```
function:
                                                            [MCQ]
                            aj
 void f(struct node *q)
                                    next
                                             next
                                                      next
                                                                next
                                   2000
                                                       1000
   if(q==NULL) return;
                                 1000
                                          2000
                                                     3000
                                                             400
   f(q->next);
printf("%c", q->data);
                  DCBA
                                                   Pf(A)
 The output is-
 CDBA
 DCBA
 ABCD
 BCDA
```

## Consider the following statements:

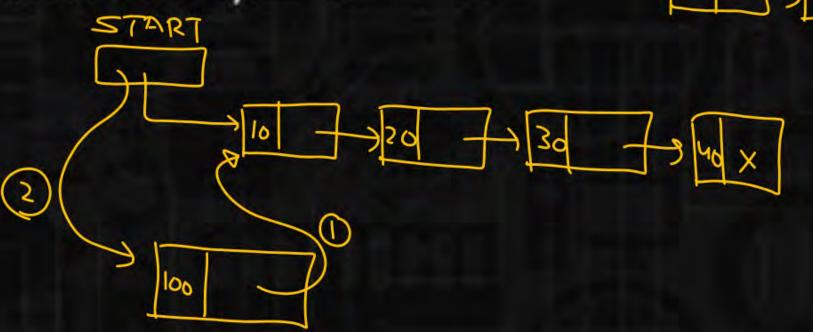

P: Insertion at the end of the linked list is difficult than insertion at the beginning of the linked list.

Q: Deletion at the beginning of linked list is easier as compared to deletion at the end of the linked list.

Which of the following statements is/are CORRECT?

- A. Both P and Q
- B. Ponly
- C. Q only
- D. Neither P nor Q

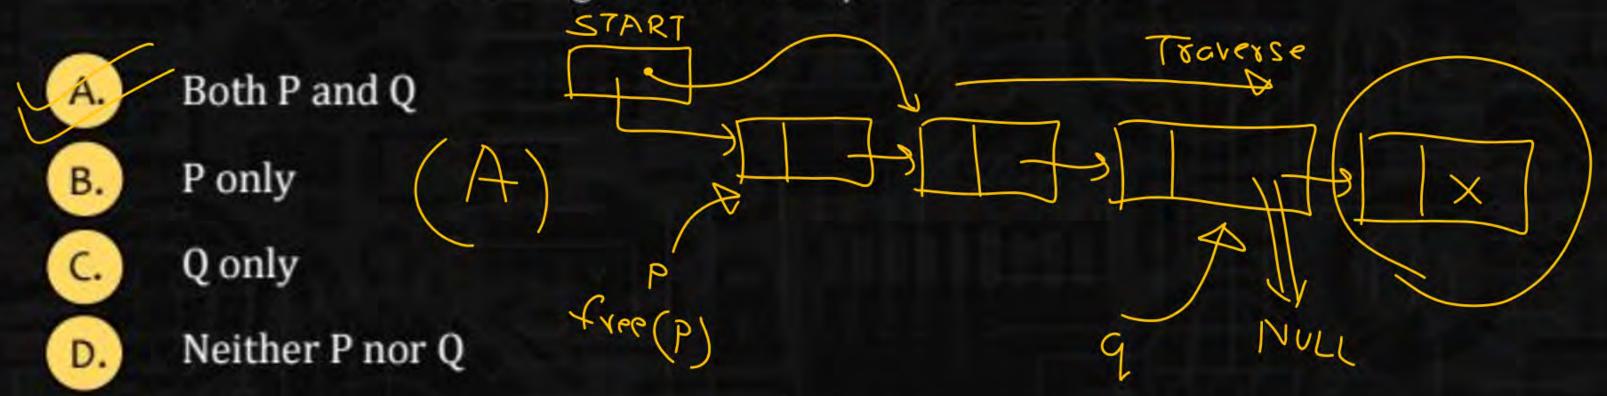

## Consider the following statements:

P: Insertion at the end of the linked list is difficult than insertion at the beginning of the linked list.

Q: Deletion at the beginning of linked list is easier as compared to deletion at the end of the linked list.

Which of the following statements is/are CORRECT?

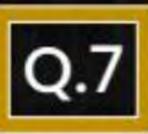

The following C function takes a single-linked list p of integers as a parameter. It deletes the last element of the single linked list. Fill in the blank space in the code:

```
struct node {
      int data;
      struct node *next;
                                                    next
                                                                          mext
                                                               next
};
void delete_last(struct node *head)
      struct node *p=head, *q;
      if(!head) return;
      if(head->next==NULL){free(head);head=NULL;
                                                                     or ->next = NULL
      return;} P-> pext 1= NULL
                                      a: !head; b: q->next = NULL; f (e)
      while(
       q = p;
       p=p->next;
                                      a: p->next! = head; b: q->next = q
           ay-next = NULL
                                      a: p->next! = NULL; b: q->next = NULL
      free(p):
      g=NULL; p=NULL;
                                      a: head->next! = p; b: q->next = p
```

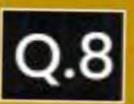

E

D.

В

Consider a single linked list q[['A', 'B', 'C', 'D', 'E', 'F', 'G'] is passed to the

```
following function:
                                                               [MCQ]
void func(struct node *head){
  struct node *p=head, *q=head;
  while(q!=NULL && q->next!=NULL && q->next->next != NULL){
    p=p->next;
                          head
    q=q->next->next;
    printf("%c", p->data);
The output is-
```

next

NULL

The following C function takes a single-linked list p of integers as a parameter. It inserts the element at the end of the single linked list. Fill in the blank space in the code:

```
struct node
                                                  head
   int data;
   struct node *next;
                                                          10
void insert_last(struct node *head, struct node *q){
struct node *p=head;
                      P->next |= NULL
if(!head) return;
while(
      p=p->next;
                                        a: !head; b: q->next = NULL;
      q=NULL;
      p=NULL;
                                        a: q \rightarrow next! = NULL; b: p \rightarrow next = q
Assume, q is the address
                                       a: p - next! = NULL; b: p - next = q
of the new node to be added.
                                       a: head->next! = p; b: q->next = p
```
